## Abstract

Undoubtedly, the stability is one of the most important principles underpinned by the country's development plan. Due to the increasing consumption-induced crises and waste of resources, more pressure of industrial human and the growing population of growing consumerism, there is no choice but planning and detailed engineering for resource consumption and productivity for decision-makers. Architecture, always, has been one of the influential factors and cultural identity of the whole period of human civilization. We know many thinkers who, in keeping with today's concerns, have made sustainable architecture a priority in their plans and designs. Citizenship rights, which are developed in the context of cultural, social, economic, and political development in advanced and developing countries, today are one of the main indicators of progress and its observance from the pillars, is closely related to architecture and sustainable development. Due to the unique features of architecture in organizing space to get the right solutions, examining the relationship between architectural space of civil rights and its impact on sustainable development is the subject that has led us to explore this important aspect of this relationship. By using the books, research journals, and review in done researchs, we highlighted the role of the architectural environment in achieving the goals of citizenship rights with an emphasis on sustainable development.

**Key words:** Architectural Space, City, Citizen, Citizenship Rights, Sustainable Development, Citizen Rights Charter
